CENTRE FOR LEARNING ANALYTICS MONASH

PEOPLE PROJECTS PUBLICATIONS NEWS EVENTS COLLABORATION

Paving the path for better education

From informing policies to improving learning spaces, we're using technology in diverse ways to expand our understanding of human learning – and enhance education for all.

Centre for Learning Analytics at Monash (CoLAM)

Our centre is a world-leader in learning analytics – and a globally-renowned hub for educating students and professionals in this area. Gathering top expertise from around the world, we're developing our field while making a real-world impact.

A (REBOOTED) HUMAN-CENTRED LEARNING ANALYTICS SITUATION

<<Interaction>>

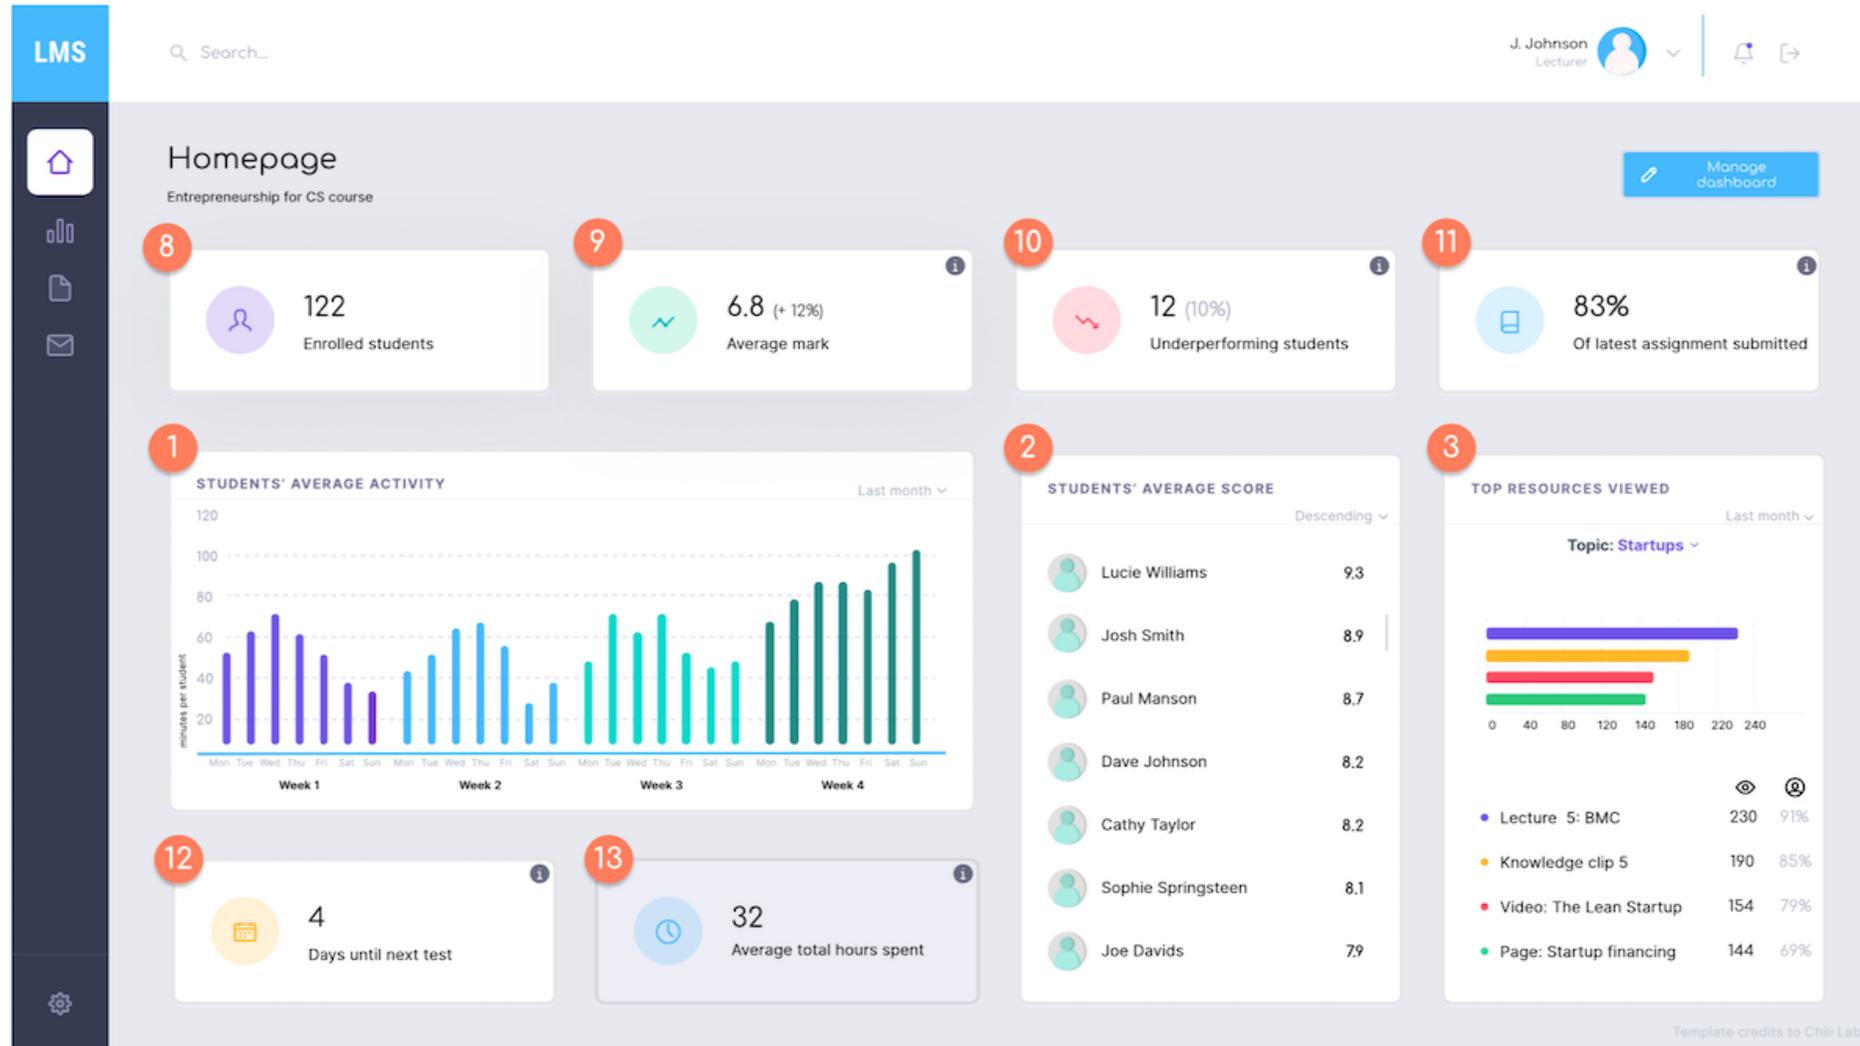

LEARNING ANALYTICS IN THE CLASSROOM

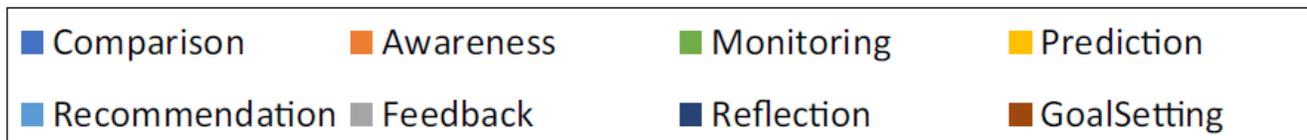

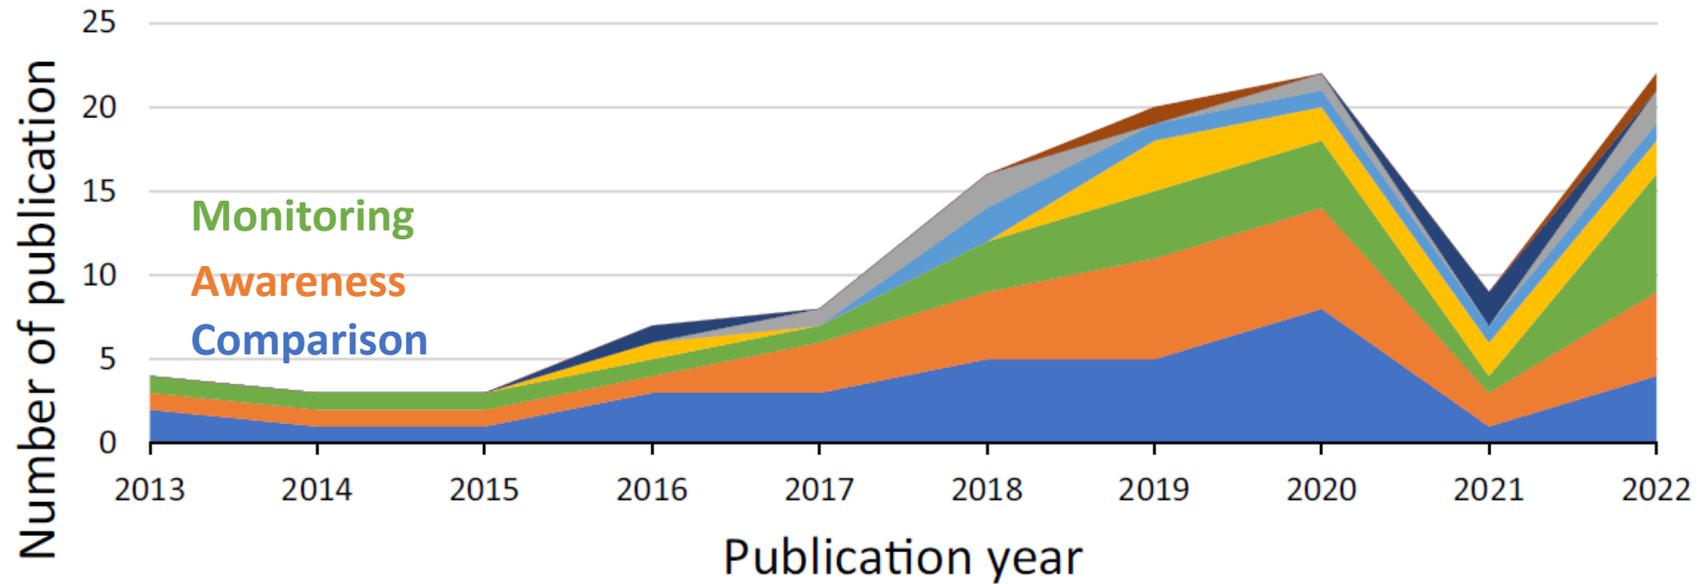

Within dashboards, visualizations are frequently used to provide a visual representation of education data to support **self-regulated learning, reflection, pedagogical interventions and teacher-student dialogues.**

ONLINE DASHBOARDS

TO ADDRESS LEARNING, Dashboards are becoming ...

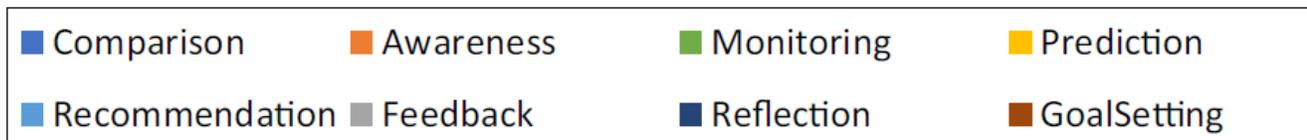

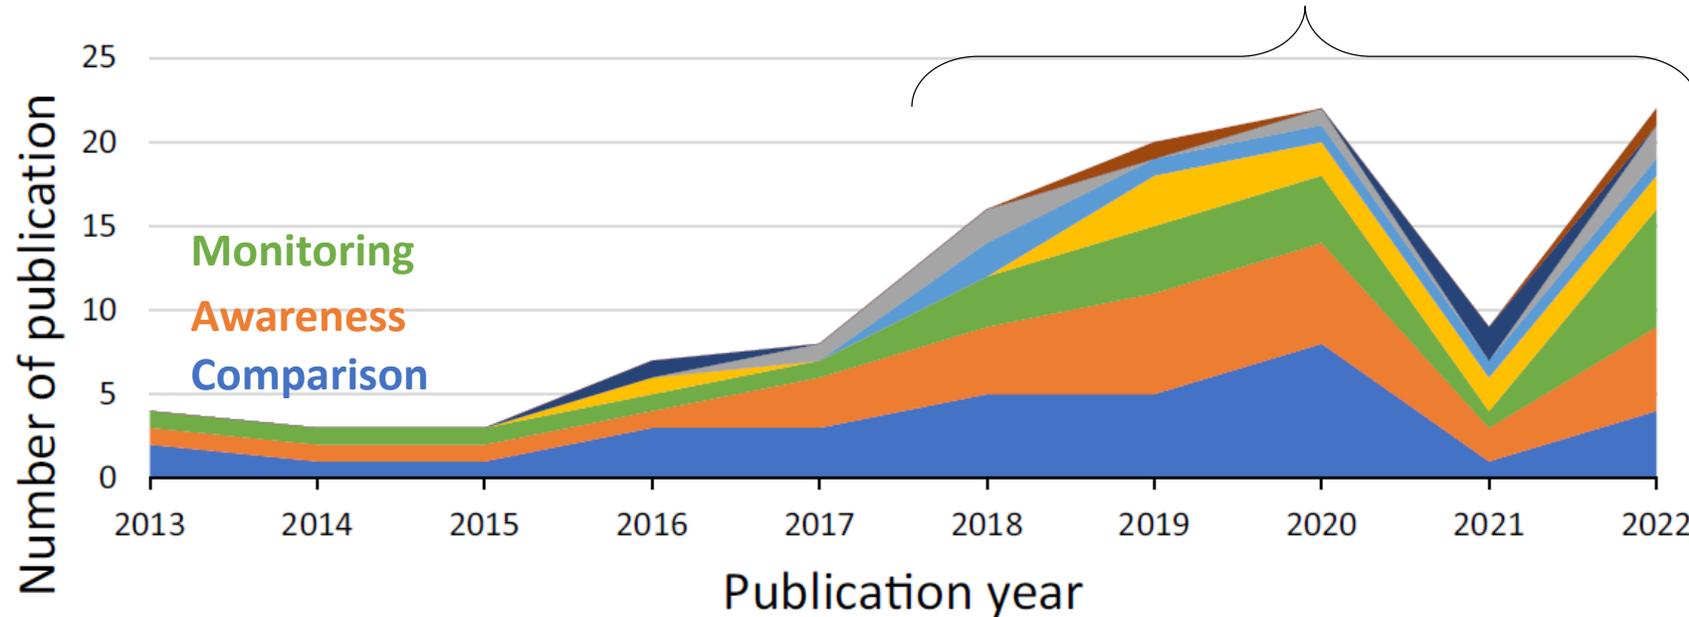

Paulsen, L., & Lindsay, E. (2024). Learning analytics dashboards are increasingly becoming about learning and not just analytics-A systematic review. *Education and Information Technologies*, 1-30.

TO ADDRESS LEARNING,

Dashboards are becoming more complex

Multiple objectives including prediction, recommendations and feedback.

Paulsen, L., & Lindsay, E. (2024). Learning analytics dashboards are increasingly becoming about learning and not just analytics-A systematic review. *Education and Information Technologies*, 1-30.

Dashboards

ARE BECOMING MORE **MULTIMODAL**

Our results imply that external data sources are needed in order to support diagnostic and prescriptive analytics, the types of analytics that we argue are needed in order to support students' learning through affordances such as feedback, reflection and recommendation. Dashboards limited to LMS data are by that nature also restricted in what they can present to students, and to what degree they can understand and support students' learning processes.

Education and Information Technologies
<https://doi.org/10.1007/s10639-023-12401-4>

Learning analytics dashboards are increasingly becoming about learning and not just analytics - A systematic review

Lucas Paulsen¹ · Euan Lindsay²

2023

emerging themes in the design and implementation of learning analytics dashboards in higher education. Learning analytics dashboards are often criticised for focusing too much on the analytics, and not on the learning. This review is then guided by an interest in whether these dashboards are student-driven or if they have become pedagogically driven. The review has identified themes of technological maturity, data sources, and analytical levels over time. The review identifies an emerging trajectory towards student-focused dashboards. These dashboards are informed by theory-oriented frameworks, designed to incorporate affordances that supporting student learning, and realised through integration of more than just activity data from learning management systems – allowing the dashboards to better support students' learning processes. Based on this emerging trajectory, the review provides a series of design recommendations for student-focused dashboards that are connected to learning sciences as well as analytics.

THE ROLE OF
DESIGN in
learning analytics

THE ROLE OF
DESIGN in
learning analytics

Consolidated model of learning analytics

We posit that the foundational principles of learning analytics can be grouped around three mutually connected dimensions – theory, design, and data science. We also posit that the most effective results in and with highest validity for research and practice can be achieved only once the principles of all three dimensions are considered. The consolidated model (Figure 1) does not exclude the existing models and frameworks of learning analytics, but rather complements them.

THE PROBLEM OF 'DESIGNING FOR'
INSTEAD OF
DESIGNING WITH

THIS GROUP OF OLD MEN

is debating the future
of women's health care.

Human-Centred Learning Analytics

How is this process done?

WHAT IS HUMAN-CENTRED

LEARNING ANALYTICS?

A balanced working definition of Human-Centred Learning Analytics (HCLA) can be:

the subfield of Learning Analytics focused on developing **trustworthy, reliable** systems that **augment** and **support** the capabilities of educational stakeholders, **aligning with their intentions, preferences, interests, and values.**

RAPID PROTOTYPING

Create

Low and high fidelity prototyping with teachers and students.

Prieto-Alvarez, C. G., Martinez-Maldonado, R., & Shum, S. B. (2018). Mapping learner-data journeys: Evolution of a visual co-design tool. In *Proceedings of the Australian Conference on Computer-human Interaction*.

CHALLENGE #1

The **challenge**: The educational stakeholders participating in a HCLA project may be **highly motivated, exceptional individuals**, such as high-achieving students or innovative teachers.

This could result in a skewed representation in the participants of the LA design process.

CHALLENGE #1

Potential strategies:

Designing solutions for underrepresented users can often derive breakthroughs that would benefit everyone (Nielsen, 2013)

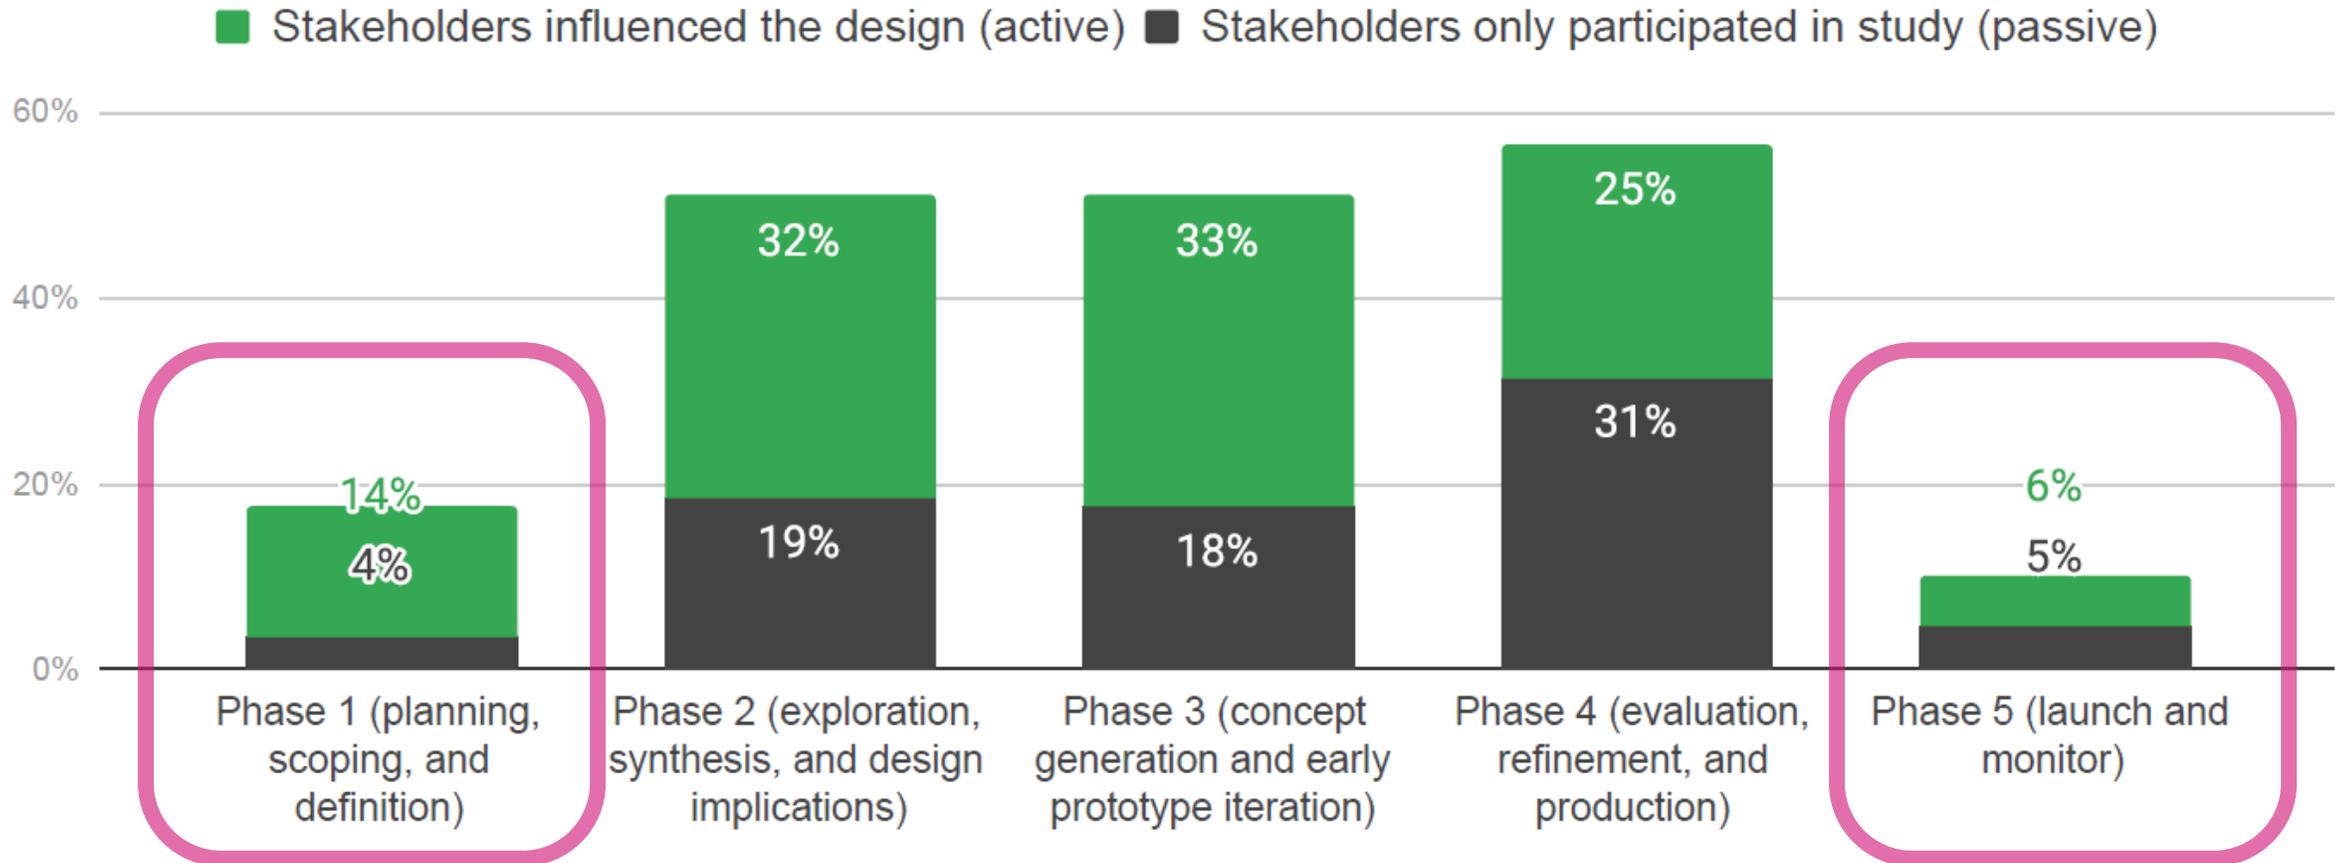

Make use of inclusive design toolkits (e.g., the Cambridge Inclusive Design Kit)
http://www.inclusivedesigntoolkit.com/tools_guidelines/

Nielsen, J. (2013). Usability for Senior Citizens: Improved, But Still Lacking. *En Nielsen Norman Group*. Retrieved from: <https://www.nngroup.com/articles/usability-seniors-improvements>.

THERE HAS BEEN LITTLE **STAKEHOLDER INVOLVEMENT** IN THE **IDEATION AND MONITORING** PHASES OF THE DESIGN

Using LLMs, we code nurses' verbal content into **team's communication behaviours**

Automated Video Analysis

Using computer vision models, we infer objects and students' location

The teachers **co-created a web orchestration application** containing graphs and their own annotations

The screenshot displays a web application interface for a simulation debriefing session. At the top, there are three tabs: "1. Tagging", "2. Team Assessment", and "3. Debriefing" (which is highlighted in blue). Below the tabs, there are two buttons: "Stop sharing" (red) and "Projection preview" (green). The main content area is divided into three sections:

- Timeline:** A horizontal timeline from 0:00 to 23:29. Key events are marked with vertical lines and labels: "0:09 Scenario started", "2:16 Handover ends", "14:57 Secondary nurse enters", and "18:06 Doctor enters". A "Select:" dropdown menu is set to "All", with other options: "Scenario started", "Handover ends", "Secondary nurse enters", and "Doctor enters". There are "Undo" and "Redo" buttons.
- Communication Network:** A network graph with nodes representing "Primary Nurse 1" (blue), "Secondary Nurse 1" (green), "Primary Nurse 2" (red), "Secondary Nurse 2" (yellow), "Doctor", "Reluctant", and "Patient".
- Communication Behaviour:** A network graph with nodes representing "Acknowledging", "Task allocation", "Sharing information", "Escalation", "Questioning Handover", and "Responding".
- Ward Map:** A spatial map showing a ward layout with beds (Bed 2, Bed 3) and various colored dots representing data points.

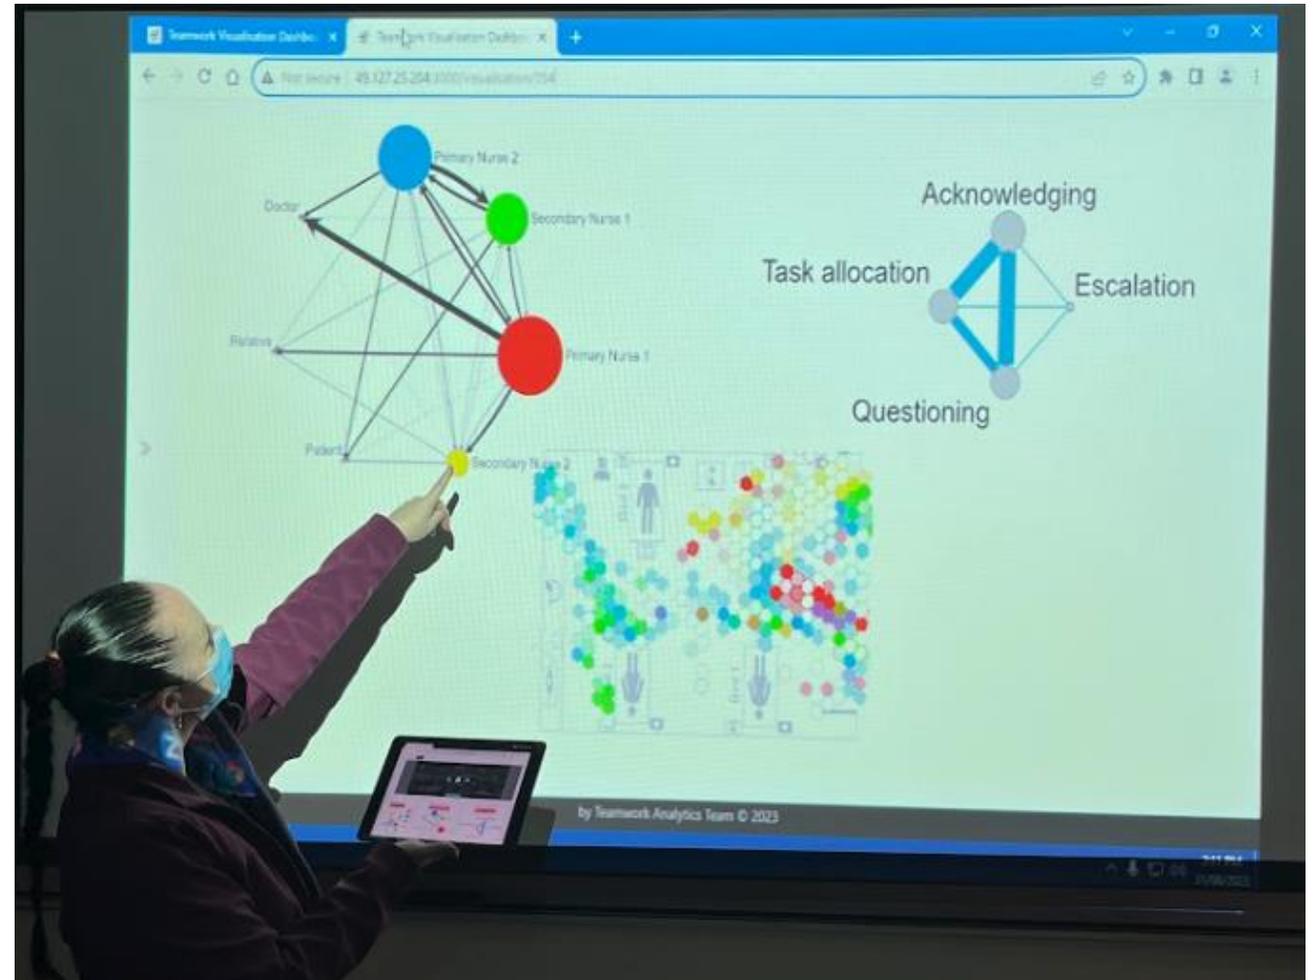

Each of the three bottom sections has a "+ Add to preview" button. The interface also includes a browser address bar at the top showing "Not Secure — 49.127.43.80" and standard navigation icons.

Teachers use the system to annotate critical moments and guide a conversation with their students about **team dynamics**

Insights

The provided dashboard offers insights into several key constructs:

- Patient Management:**
 - Prioritization: The team prioritized working individually on tasks for Ruth (47%) and working together on Ruth's tasks (24%), indicating that Ruth's care was a central focus, consistent with the learning objectives.
 - Ward Map: The team was predominantly positioned around Bed 4 (Ruth), with high speech activity, reinforcing the prioritization of Ruth's care.
- Contribution to Teamwork:**
 - Communication Network: Primary Nurse 1 (PN1) and Primary Nurse 2 (PN2) had the most extensive communication, indicating active roles in team coordination.
 - Communication Behaviour: Task allocation and information sharing were prominent, showing collaborative efforts in distributing tasks and managing patient care.
- Communication Strategies:**
 - Communication Network: The thick lines between PN1, SN1, and SN2 highlight significant communication, suggesting a well-connected team structure. The network's design reveals clear hierarchies and interaction patterns essential for effective teamwork.
 - Communication Behaviours: The balanced co-occurrence of acknowledging, sharing information, and escalation indicates a systematic approach to managing both routine tasks and critical situations.

Individual microphone audio activity capturing

Indoor-position tracking

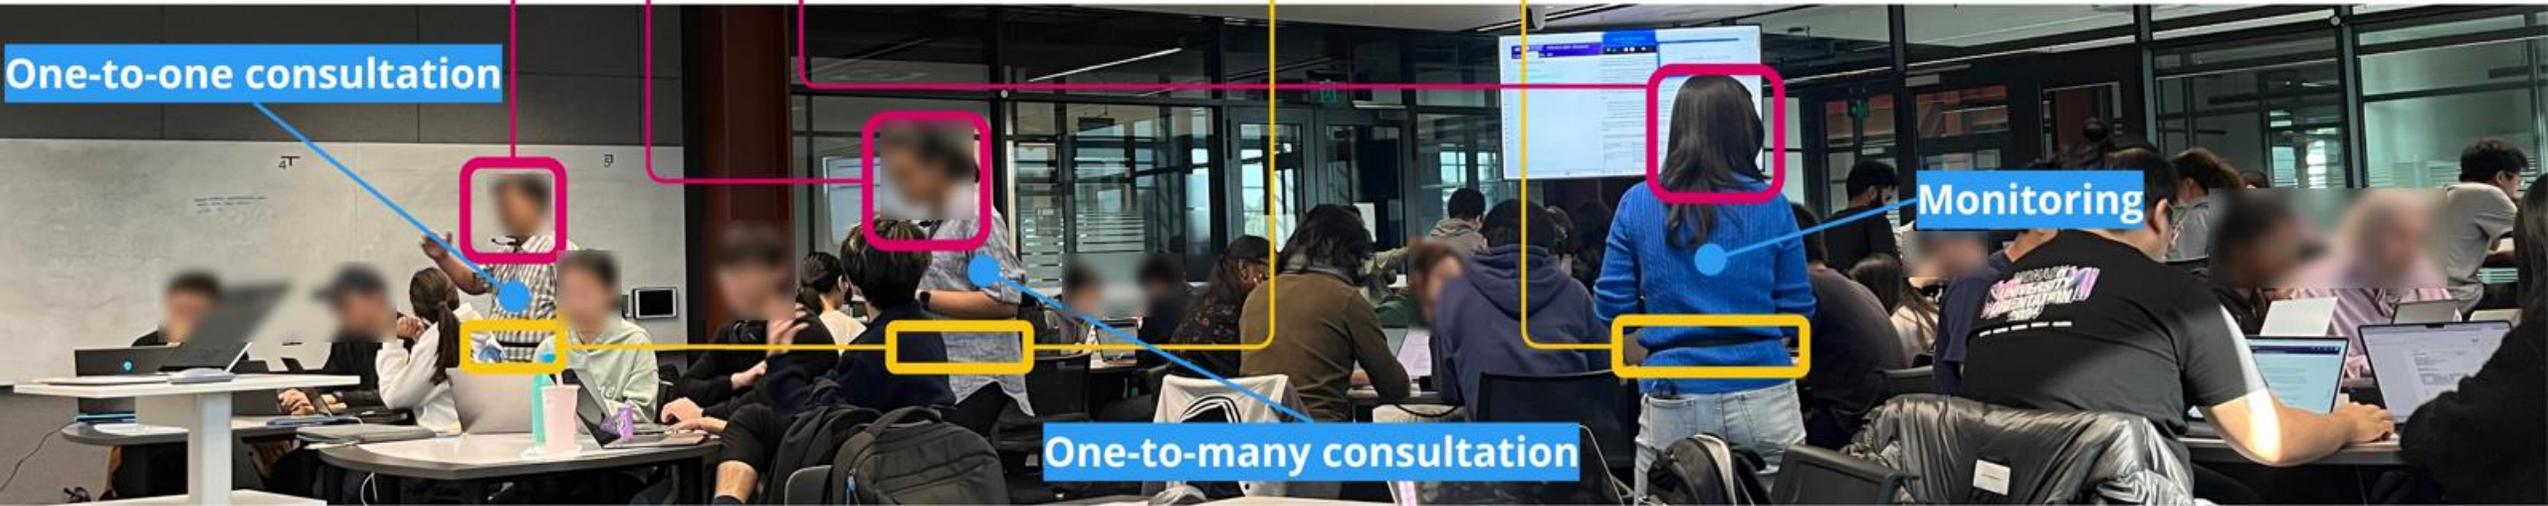

Spatial pedagogy tagging (by observer)

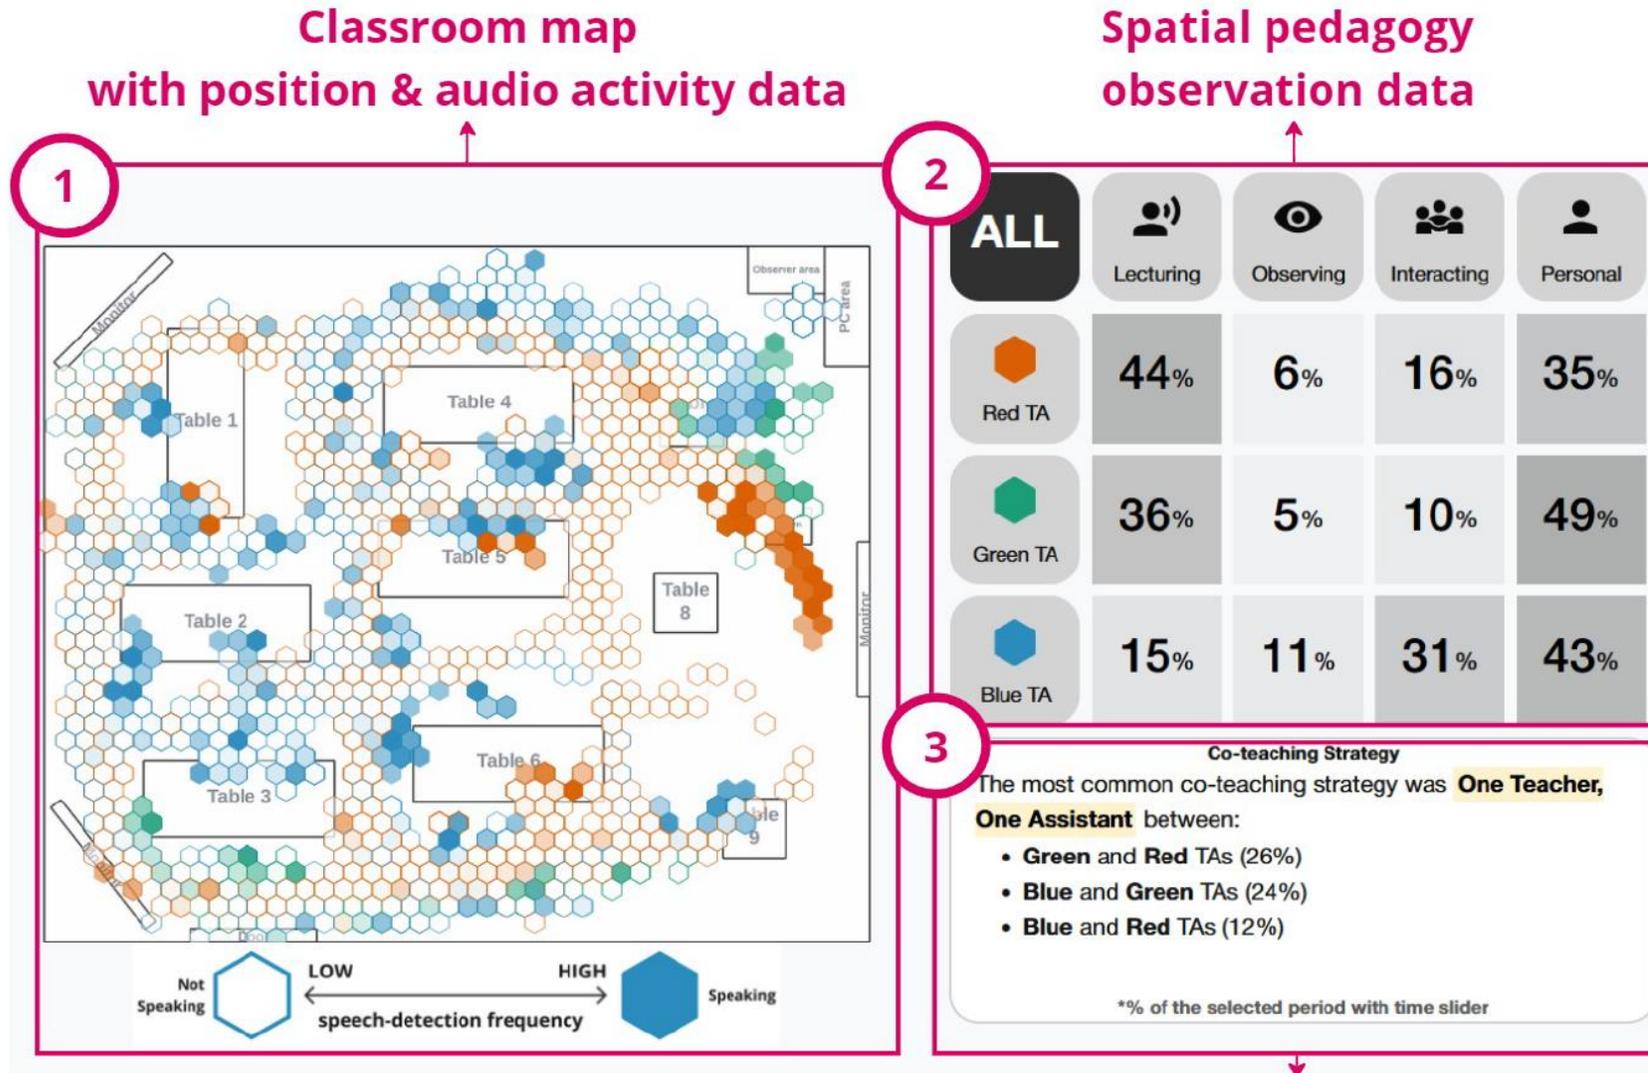

One-to-one consultation

Monitoring

One-to-many consultation

Moving to the Classroom to present the data to students

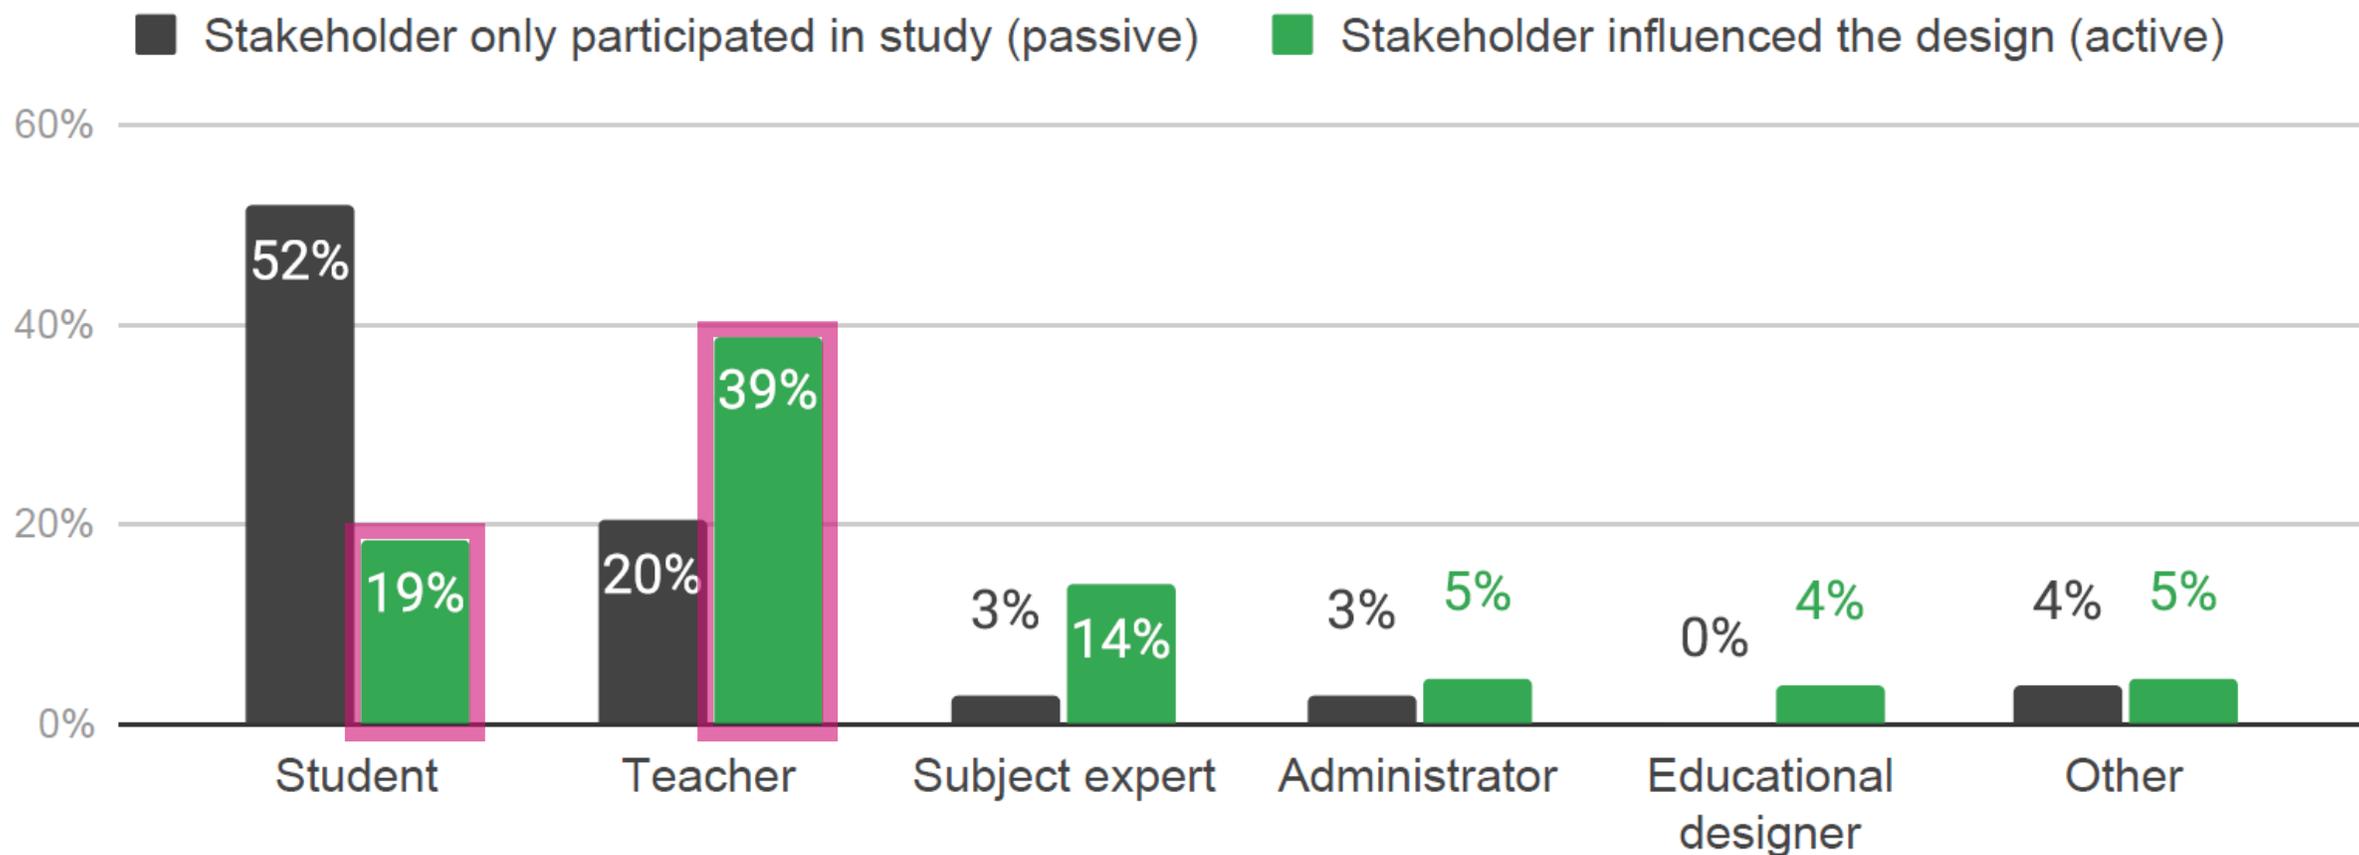

Co-teaching strategy descriptive data

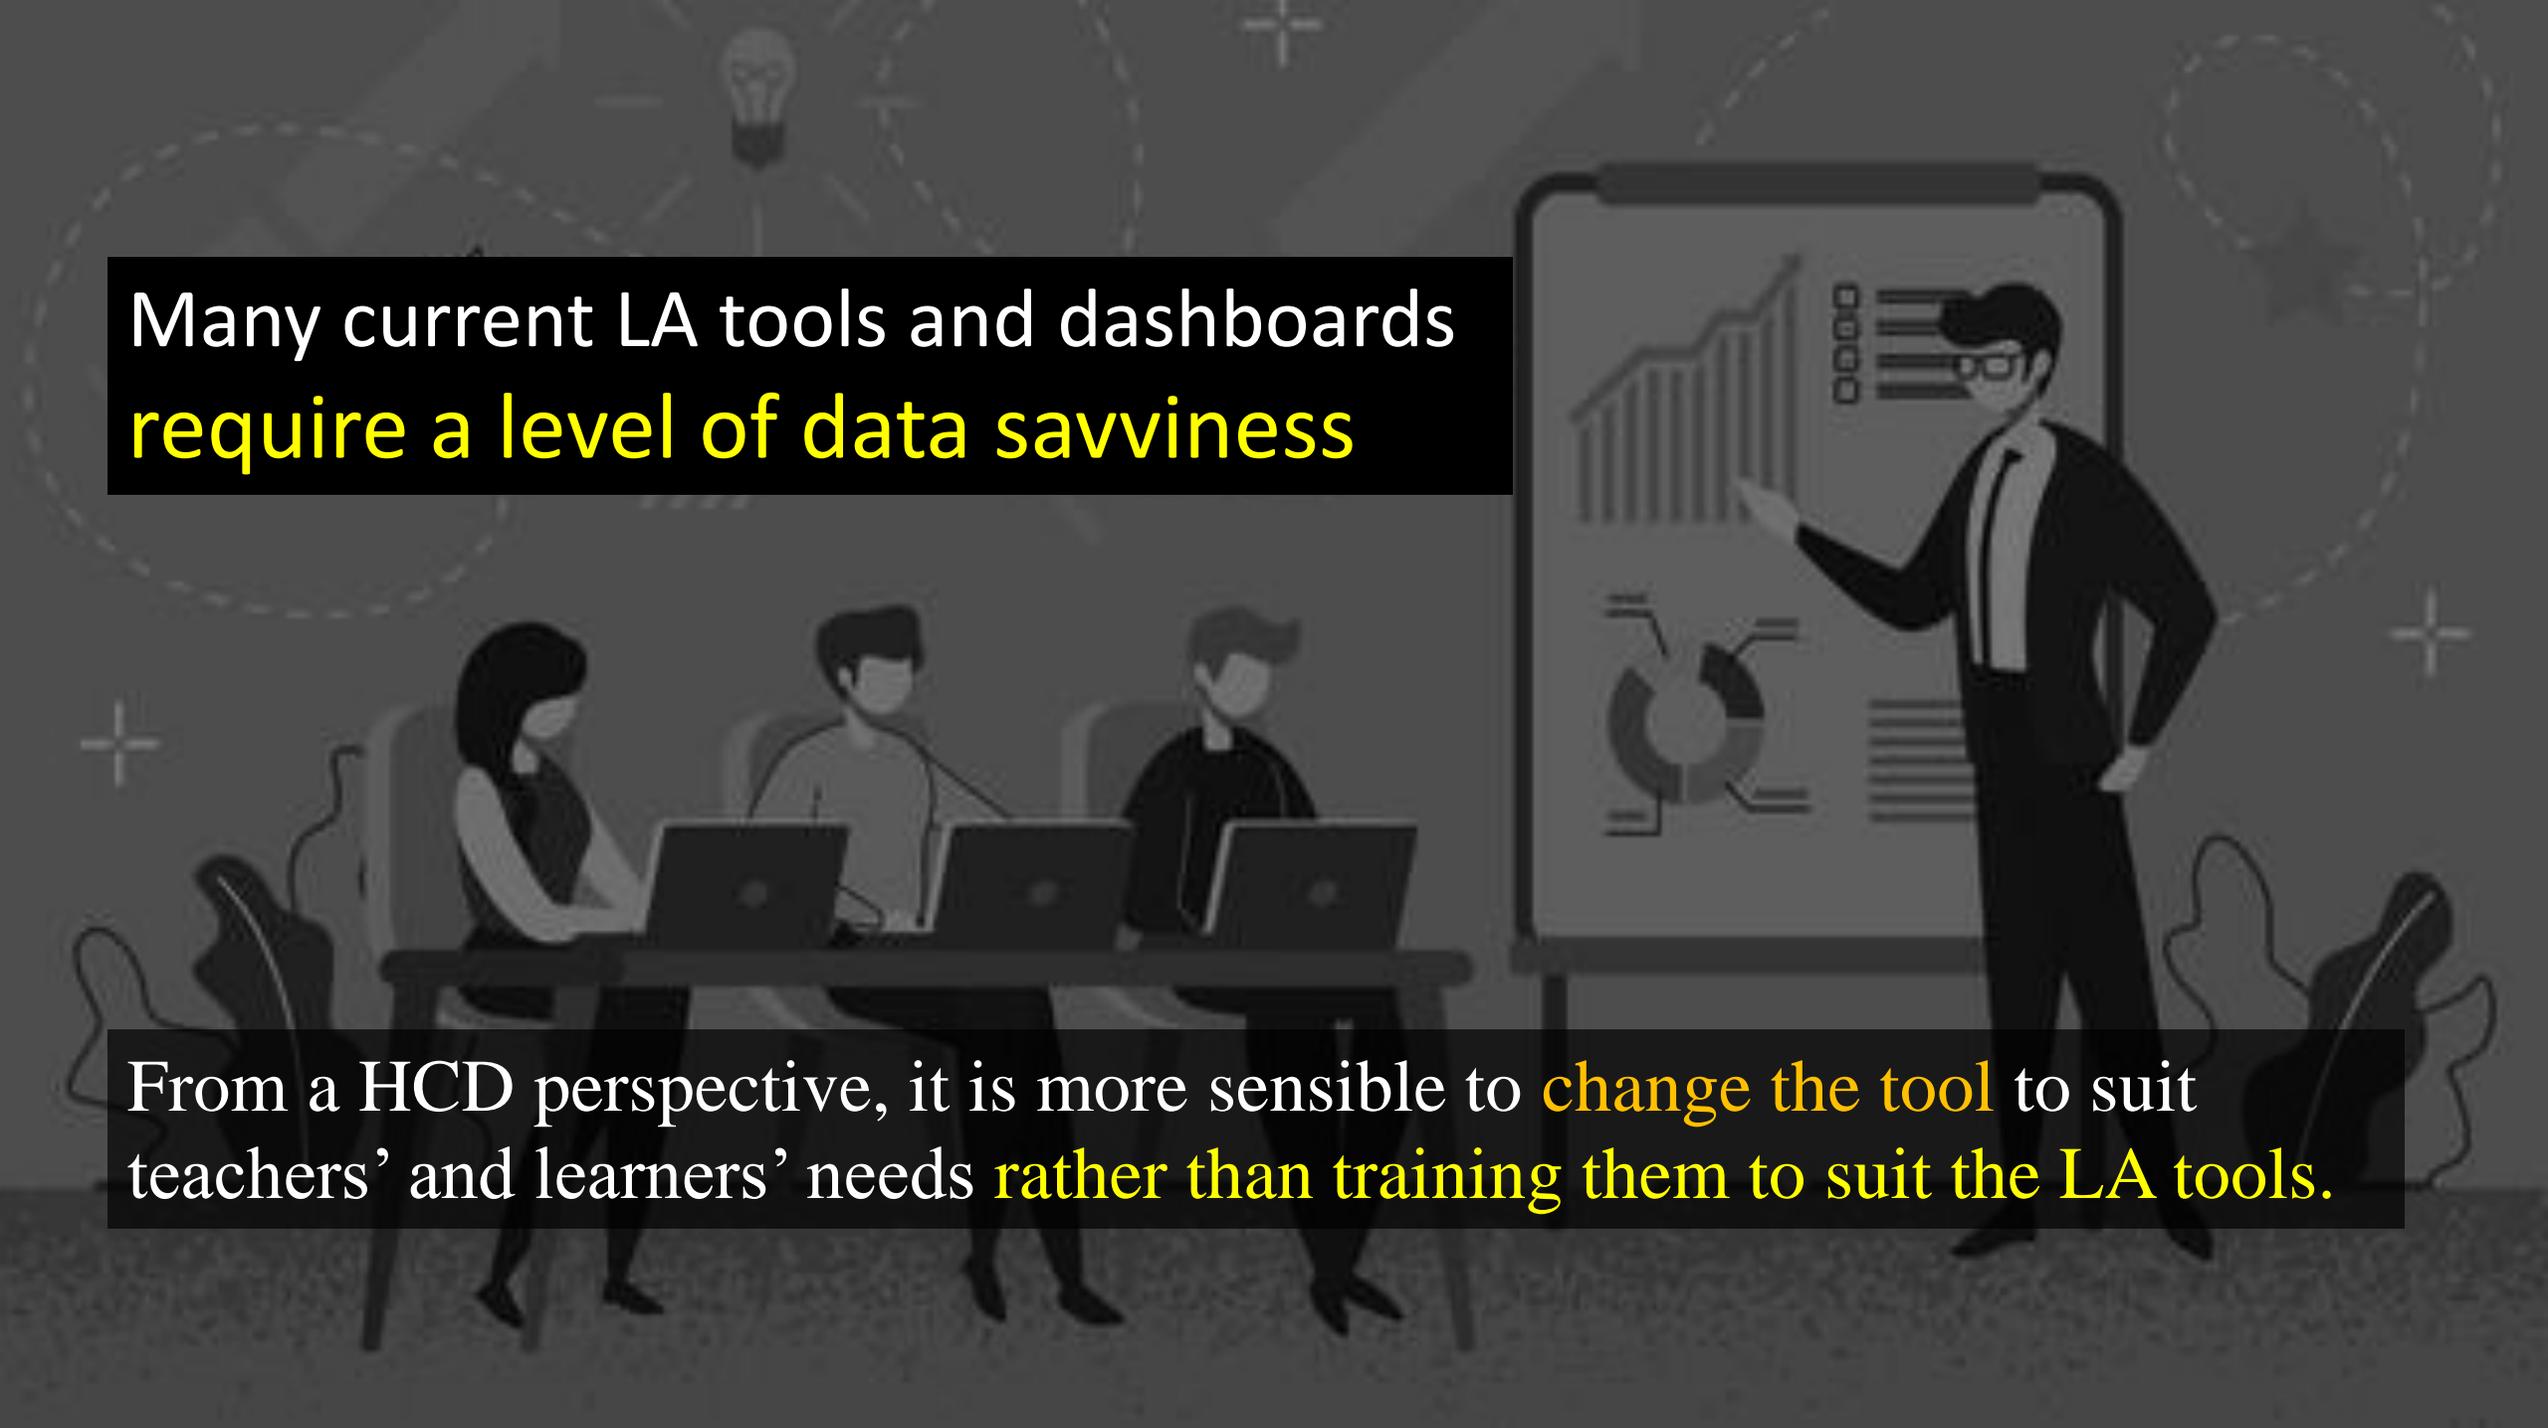

It may be quite **challenging (challenge #2)** to put yourself in the shoes of others

...designers often commonly cannot **truly** understand what teachers and students really need

THERE HAS BEEN LITTLE **ACTIVE INVOLVEMENT** OF **STUDENTS** COMPARED TO TEACHERS

Stakeholder Involvement by Education Roles

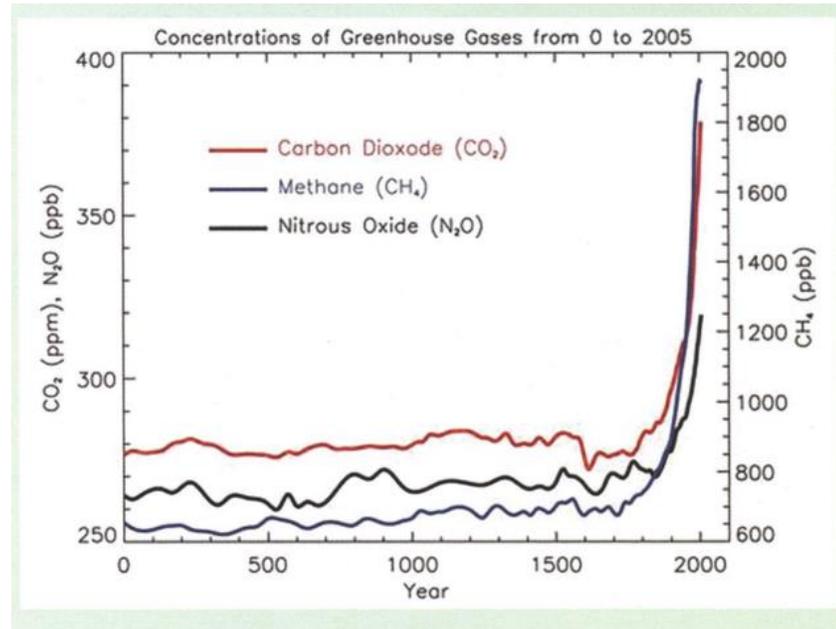

The background is a dark, stylized illustration of a classroom or meeting. On the left, three people are seated at a long table, each with a laptop open in front of them. On the right, a man in a suit and glasses stands next to a large whiteboard, pointing at a bar chart. The whiteboard also displays a donut chart and some text. The overall scene is dimly lit, with a lightbulb icon at the top center and various geometric shapes like circles and plus signs scattered throughout.

Many current LA tools and dashboards
require a level of data savviness

From a HCD perspective, it is more sensible to **change the tool** to suit teachers' and learners' needs **rather than training them to suit the LA tools.**

TEACHERS AND STUDENTS SHOULD BE CONSIDERED NON-DATA EXPERTS

THE STEM students find it hard to interpret charts and data visualisations...

“Instructors of undergraduate courses should not expect students to come into courses with high proficiency for understanding, interpreting, and creating data visualizations” (Maltese et al., 2015)

Challenge #3

Non-data experts are unlikely to be aware of the implications of AI design choices

This suggests the need for new methods particularly **tailored to engage with teachers and students** in the design of data-intensive and pedagogical meaningful LA innovations.

WHY CODESIGNING AI IS DIFFERENT AND DIFFICULT

Authors: [Malak Sadek](#), [Rafael Calvo](#), [Céline Mougenot](#)

Posted: Tue, June 27, 2023 - 12:04:00

It is estimated that 98 percent of the population are novices with regard to technology (excluding extremes such as infants) [1]. It is this 98 percent, however, that form the main chunk of users and stakeholders affected by AI-based systems. It then makes sense that members of this segment of the population should be involved in designing these systems beyond just the small, homogenous set of experts currently involved.

There have been countless calls for the introduction of a transdisciplinary, participatory design process for AI/ML systems [2,3]. Such a collaborative design (codesign) process has been heralded as especially useful in aiding explainability and transparency [4], embedding values into AI-based systems [5], providing accountability, and mitigating downstream harms arising from several cascading biases and limitations [6]. There have also been calls for collaboration within the entire AI pipeline, including in data creation and selection, instead of having designers at the front end of the process and engineers at the back end [7]. In fact, it has been said that the only way to combat existing structural and

WHY CODESIGNING AI IS DIFFERENT AND DIFFICULT

SIGN IN

[Forgot Password?](#)

Ideation and communication

- It is difficult for technical experts to explain to users and nontechnical experts an AI's behavior, what counts as AI, and what it can/cannot do.
- It is also difficult for designers to communicate AI design ideas, interactions, and appropriate use cases/user stories to technical experts, codesign partners, and users. It is also challenging to imagine ways to purposefully use AI to solve a given problem, creating an overall "capability uncertainty" [10].
- It is challenging for designers and developers to understand how to collaborate and co-ideate without a common language or shared boundary objects, especially when designers join late in the project.

back end [7]. In fact, it has been said that the only way to combat existing structural and

The challenge #4:

Power dynamics among researchers, designers, users, and other stakeholders can significantly influence decision-making in the design process.

For instance, it could lead to a situation where researchers, designers, or those stakeholders in positions of power, end up making most, if not all, decisions.

AN EMANCIPATORY PERSPECTIVE FOR LEARNING ANALYTICS

“Learners are not to be seen as passive beneficiaries of a superior control entity. With respect to software adaptations, if Learning Analytics has to play a role, it should be limited to one of awareness and recommendation.”

Tchounikine, Pierre. (2019). Learners' agency and CSCL technologies: towards an emancipatory perspective. *International Journal of Computer-Supported Collaborative Learning*, 14(2).

THE CRITICAL CONCEPTS OF EXPERTISE AND LIVED EXPERIENCE

HCD acknowledges lived experience as a credible form of expertise.

Lived experience refers to a person's experiences, decisions, and knowledge gained from these experiences (Jones, 2013).

A key tenet of co-design is that each stakeholder can contribute with **their own expertise** and, in doing so, there are higher possibilities to design something that addresses authentic needs (McKercher, 2020).

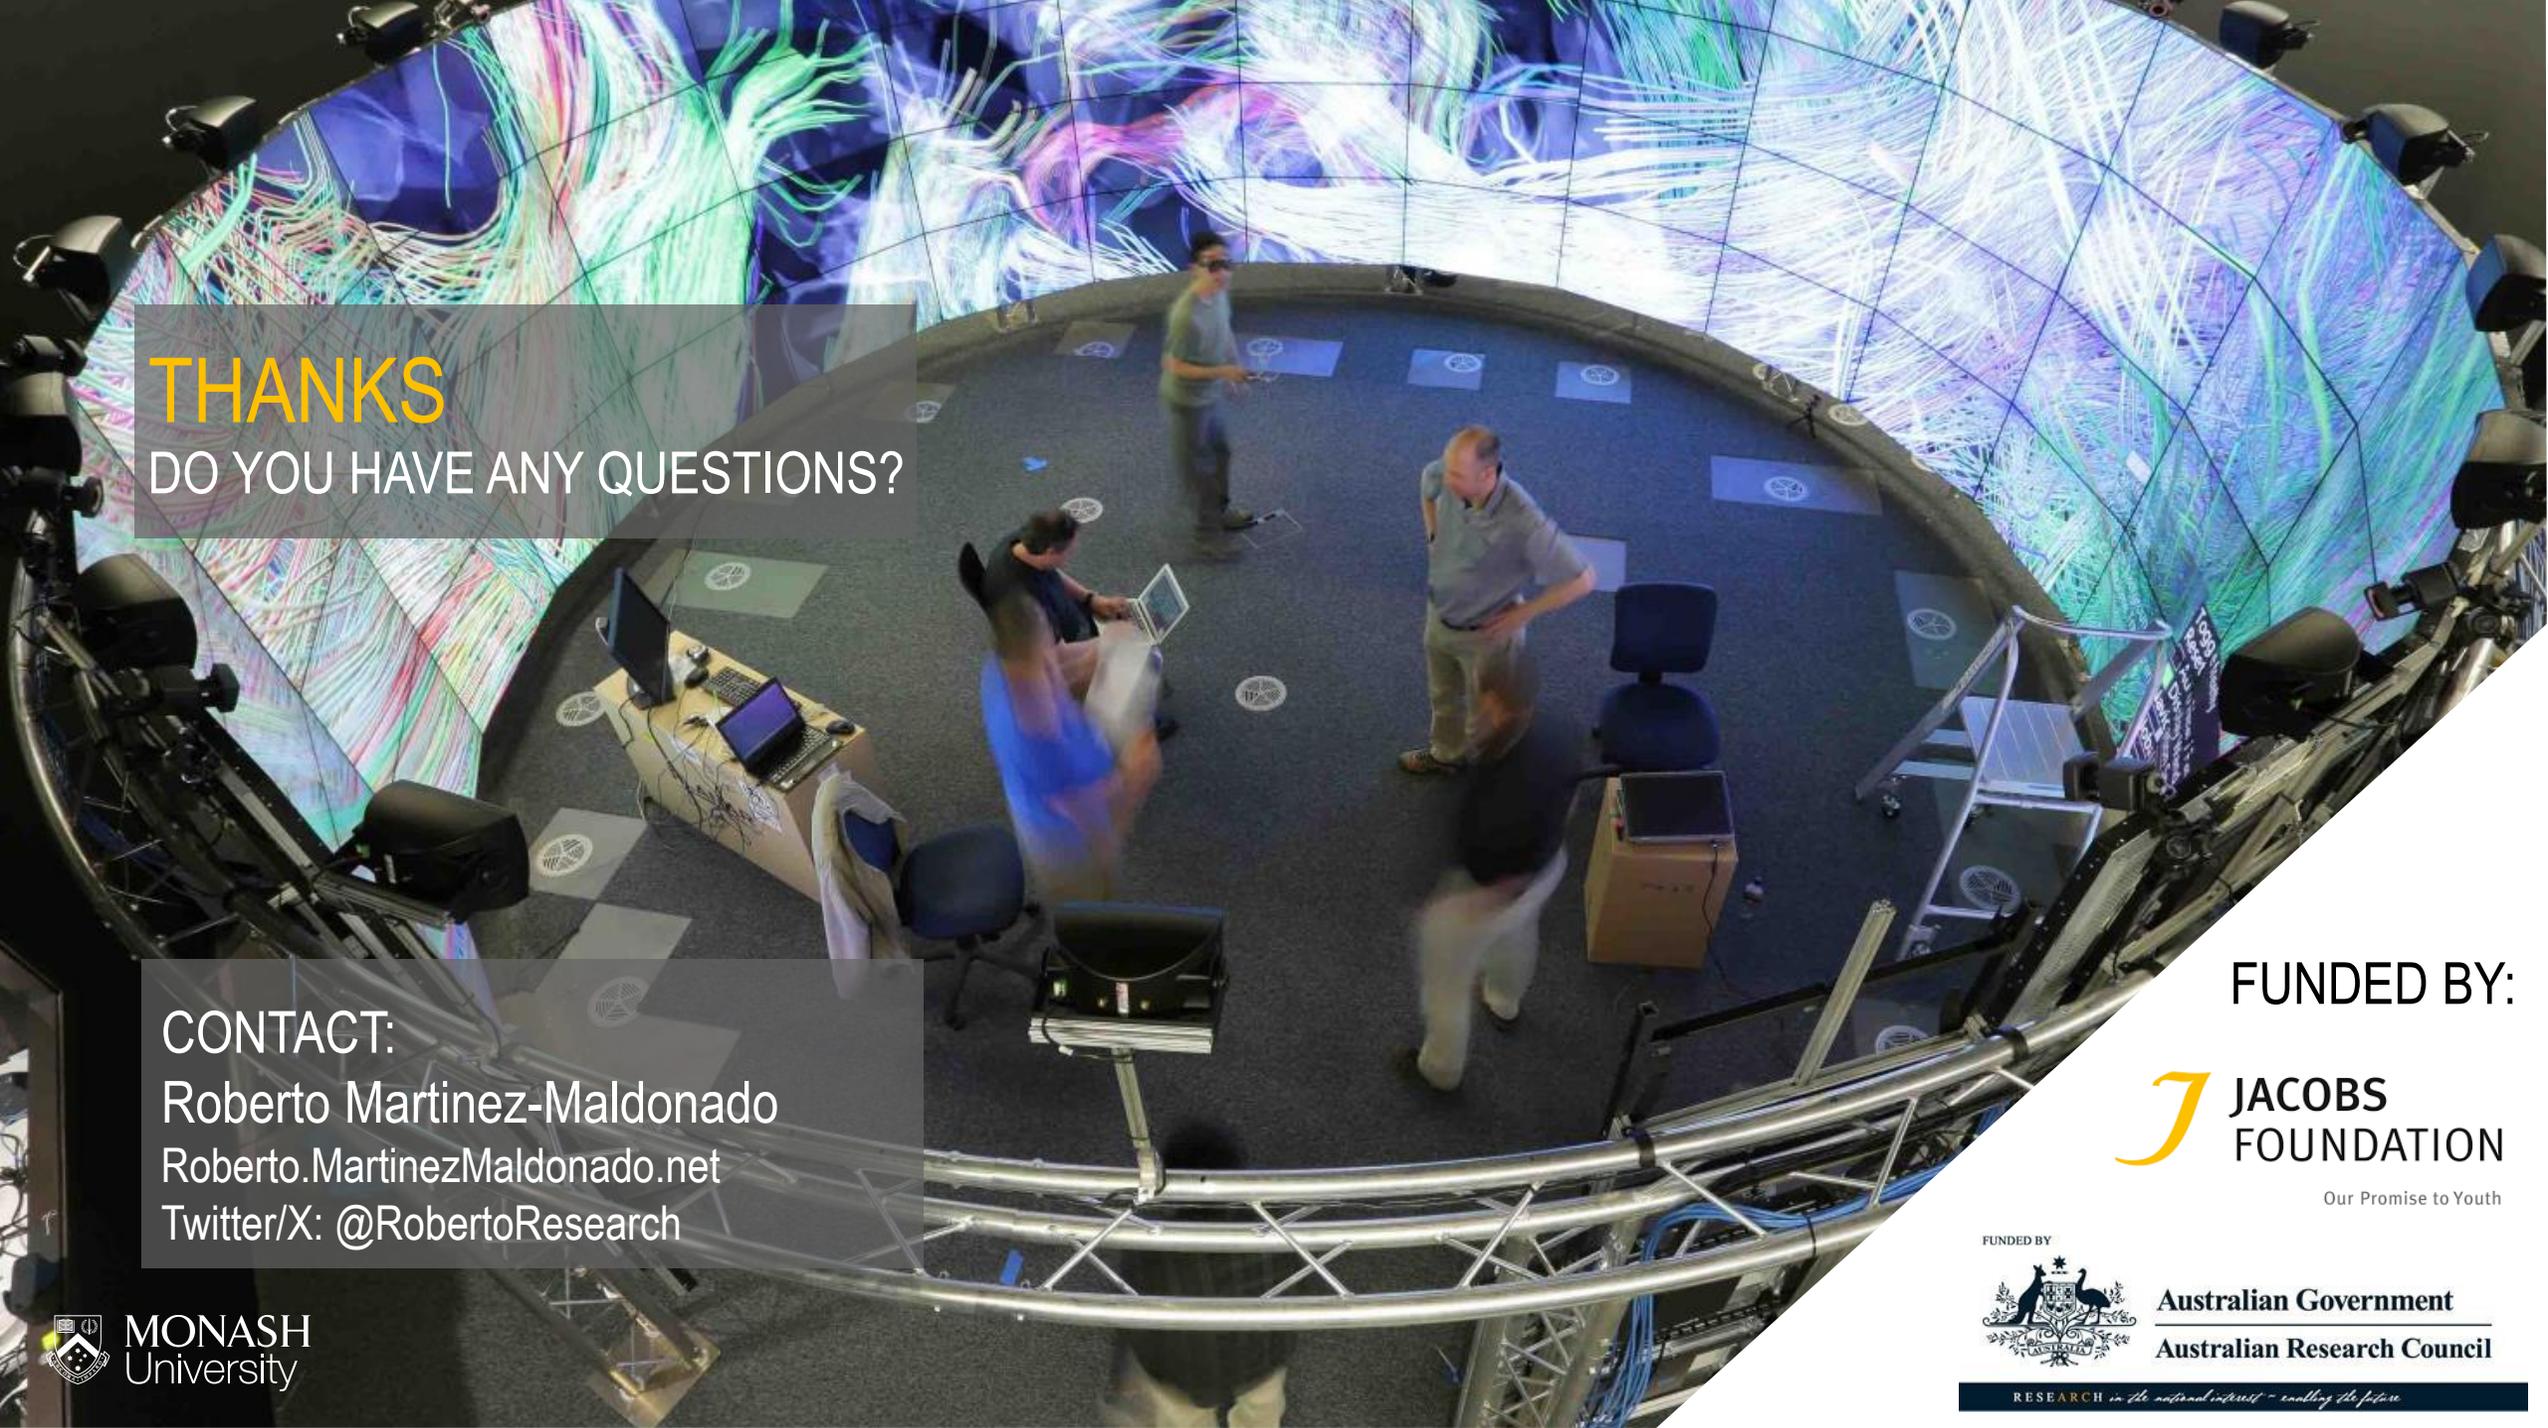

Jones, P. (2013). *Design for care: Innovating healthcare experience*: Rosenfeld Media.

McKercher, K. A. (2020). Beyond sticky notes. *Doing co-design for Real: Mindsets, Methods, and Movements, 1st Edn. Sydney, NSW: Beyond Sticky Notes.*

AI with a Human Touch: within Learning Analytics

Key take aways

- **AI is here to stay**, we need to make sure **WE are also here to stay**
- There is a big difference between **designing with** rather than **designing for**
- **Human-centredness is critical** if we don't want to lose our agency
- **Human-centred AI in Education** has some unique challenges (**casual use, expertise, skewed participation**)

THE ROLE OF THE HCD FACILITATOR

BUT IS IT CO-DESIGN?

TOOL by KA McKercher.

- a. Are people with lived experience, professionals and others involved (e.g. policy-makers, architects) working together?

This could be through researching, sharing and discussing insights, developing ideas, building prototypes or implementing new concepts

A Yes, people with different experiences are working together

B Not yet, we're warming up to people being in the same room (for example, trust is low)

C No, we learn from people with lived experience

D No, we have separate advisory groups (e.g. youth advisors)

E I don't know, show me the next question...

BUT IS IT CO-DESIGN?

TOOL by KA McKercher.

“ Learning from people (not with them) usually isn't co-design

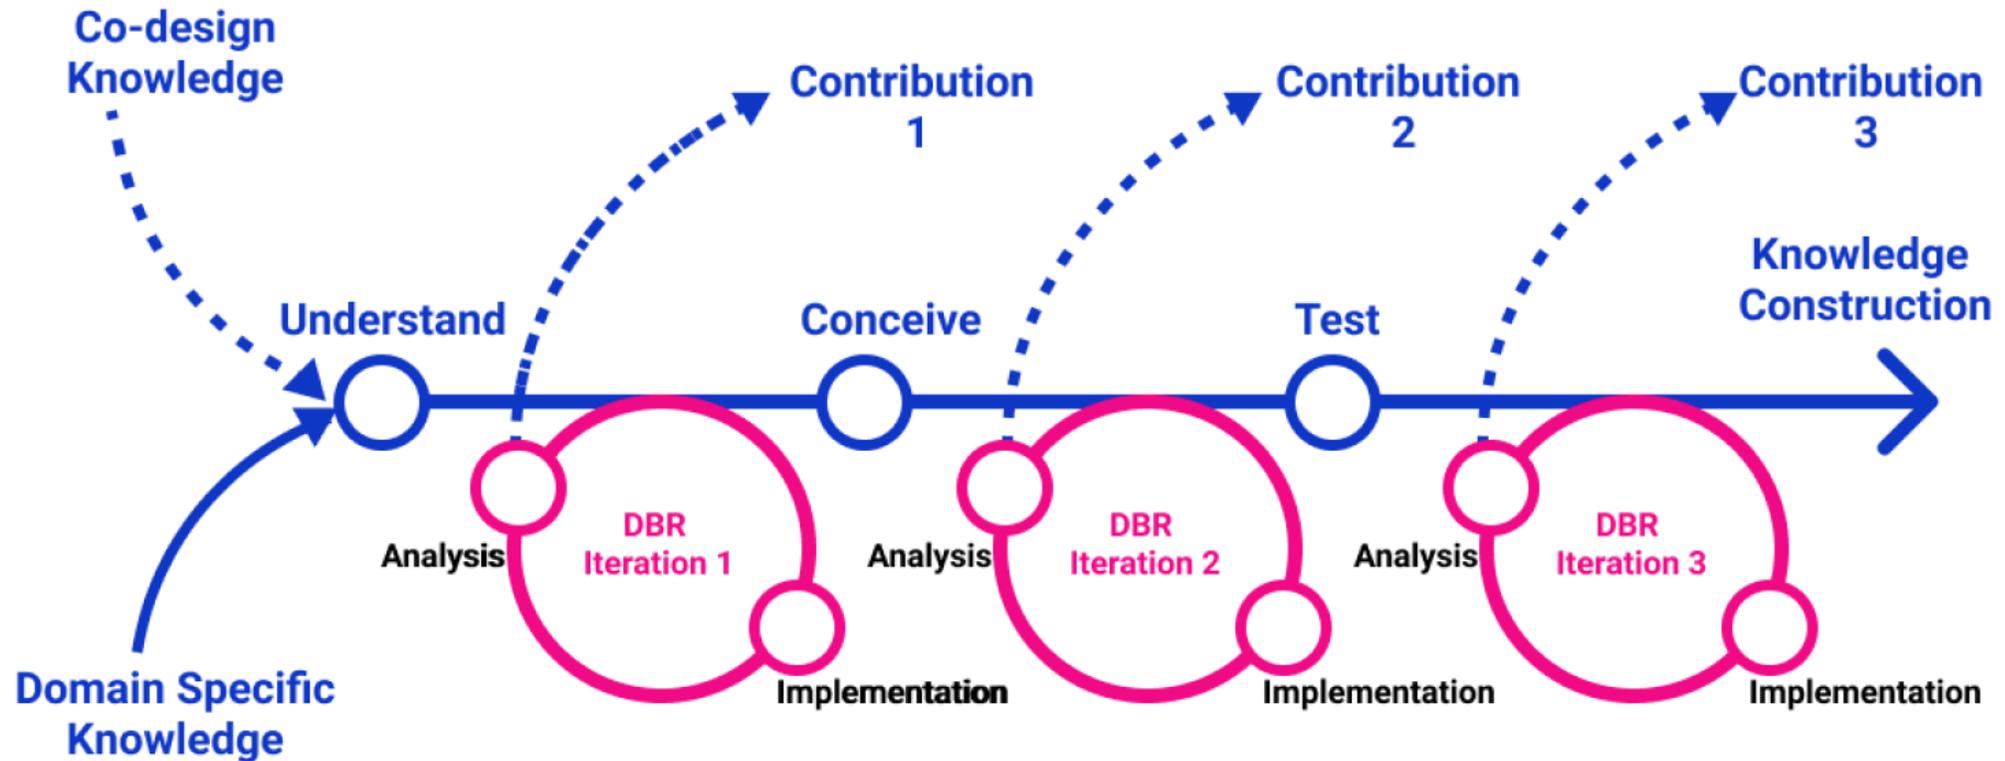

To get closer to co-design, you might involve people with lived experience in:

- Reviewing data
- Gathering stories
- Developing insights
- Identifying and making ideas
- Testing ideas
- Making decisions

Learning Analytics and Stakeholder Inclusion: What do We Mean When We Say "Human-Centered"?

Authors:  [Charles Lang](#),  [Laura Davis](#) [Authors Info & Claims](#)

LAK2023: LAK23: 13th International Learn
417 • <https://doi.org/10.1145/3576050.35>

Human-centeredness seems to rest on the idea that stakeholders have access to knowledge that researchers and designers do not, and access to this knowledge will create better research and design products. This may be true, but there is no reason why it must be true, or even true a majority of the time. Especially within a field such as learning analytics where tools, data and people are interacting in new ways. It seems more likely that such a context would be unfamiliar to all stakeholders, from researchers to users.

WHY HUMAN-CENTRED DESIGN?

“Eric Von Hippel of the MIT Business School has noted that “70% to 80% of new product development that fails does so not for lack of advanced technology, but because of a **failure to understand users’ needs.**”

Joseph Giacomin, 2012 seminar

Human-Centered Design Considered Harmful

By Donald A. Norman > Nielsen Norman Group > norman@nngroup.com

Human-centered design has become such a dominant theme in design that it is now accepted by interface and application designers automatically, without thought, let alone criticism. That's a dangerous state—when things are treated as accepted wisdom. The purpose of this essay is to provoke thought, discussion, and reconsideration of some of the fundamental principles of human-centered design. These principles, I suggest, can be helpful, misleading, or wrong. At times, they might even be harmful. Activity-centered design might be superior.

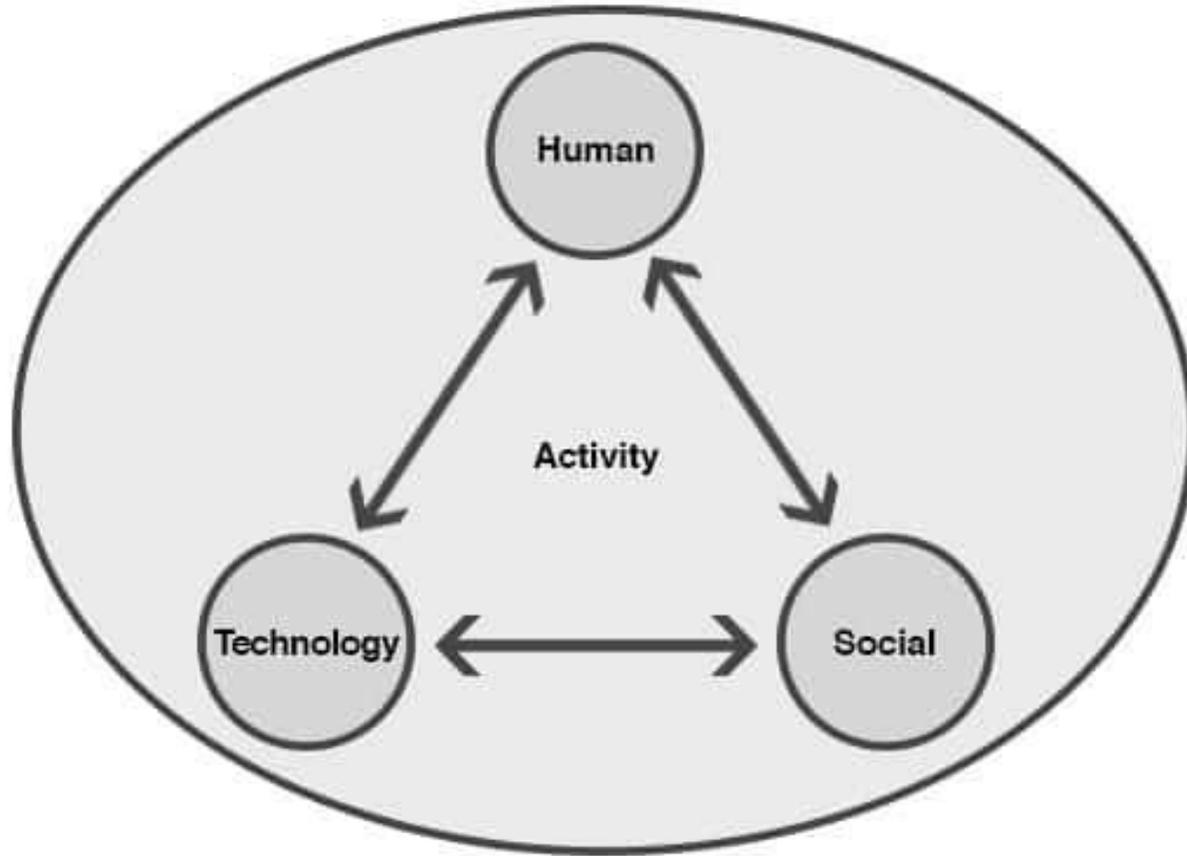

Most items in the world have been designed without the benefit of user studies and the methods of human-centered design. Yet they do quite well.

Moreover, these include some of the most successful objects of our modern, technological worlds.

Consider two representative examples:

The Automobile. People all over the world learn to drive quite successfully with roughly the same configuration of controls. There were no systematic studies of users. Rather, early automobiles tried a variety of configurations, initially copying the seat-

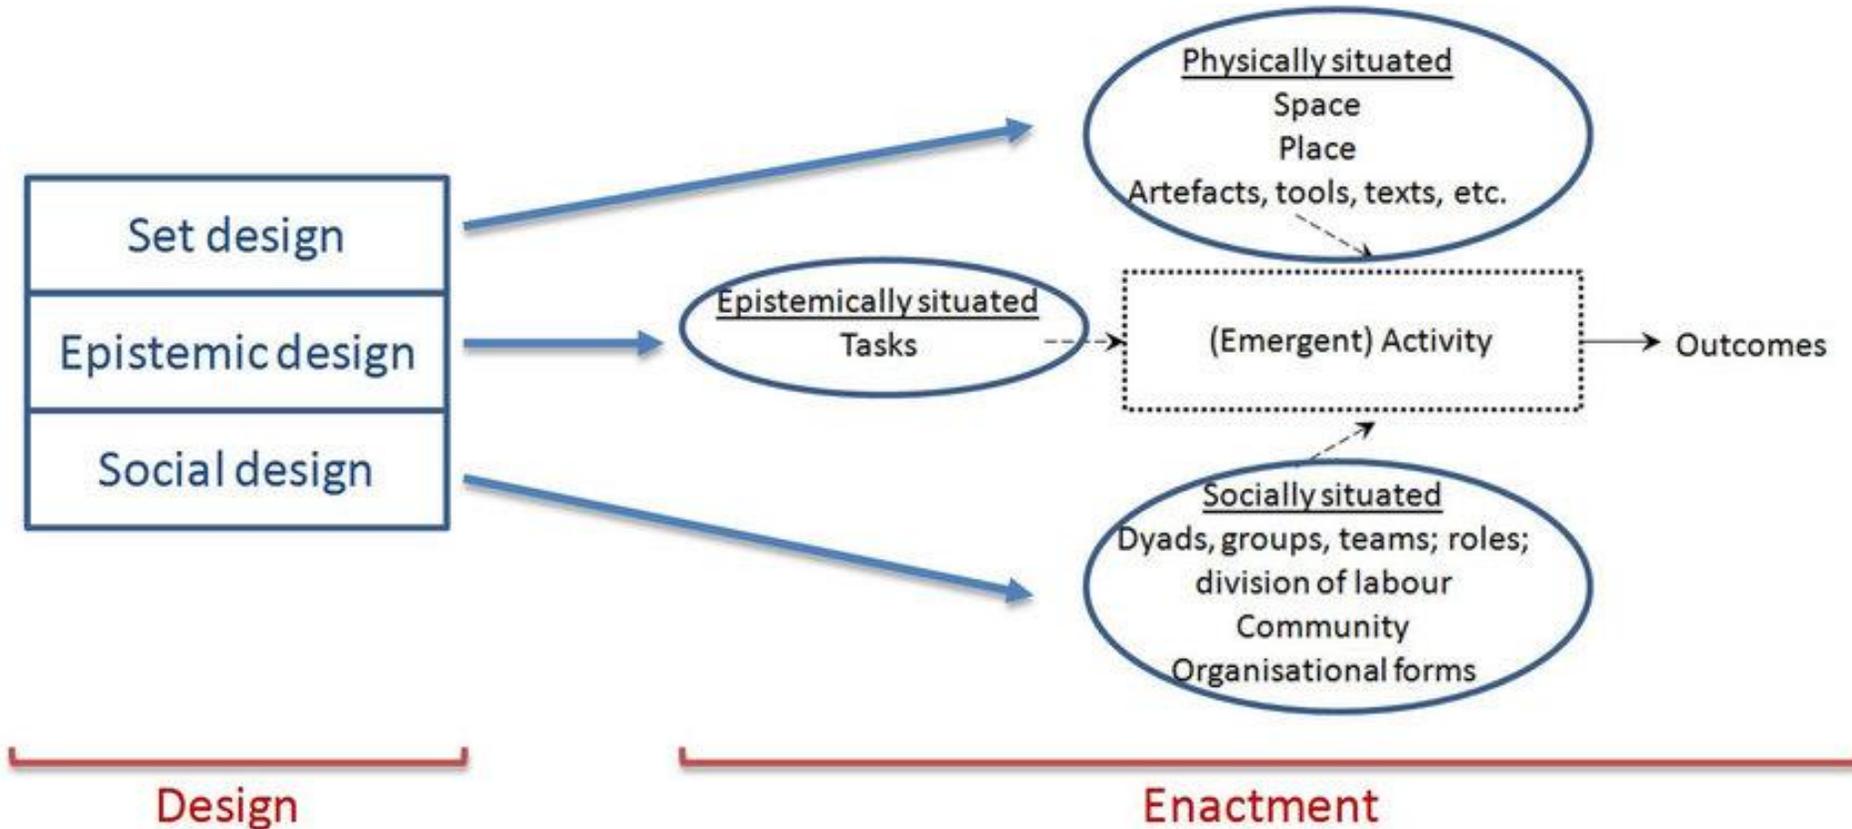

HUMAN-CENTRED IS NOT THE SAME AS HUMAN CENTRIC

Human centredness includes all the **human** factors, **social** factors and **technology** factors interact together under the human activity umbrella.

LEARNING ANALYTICS ARE ABOUT LEARNERS AND EDUCATORS

Chapter 1: Theory and Learning Analytics

Simon Knight, Simon Buckingham Shum

Connected Intelligence Centre, University of Technology Sydney, Australia
DOI: 10.18608/hia17.001

ABSTRACT

The challenge of understanding how theory and analytics relate is to move "from clicks to constructs" in a principled way. Learning analytics are a specific incarnation of the bigger shift to an algorithmically pervaded society, and their wider impact on education needs careful consideration. In this chapter, we argue that by design – or else by accident – the use of a learning analytics tool is always aligned with assessment regimes, which are in turn grounded in epistemological assumptions and pedagogical practices. Fundamentally then, we argue that deploying a given learning analytics tool expresses a commitment to a particular educational worldview, designed to nurture particular kinds of learners. We outline some key provocations in the development of learning analytic techniques, key questions to draw out the purpose and assumptions built into learning analytics. We suggest that using "claims analysis" – analysis of the implicit or explicit stances taken in the design and deploying of technologies – is a productive human-centred method to address these key questions, and we offer some examples of the method applied to those provocations.

Keywords: Theory, assessment regime, claims analysis

In what has become a well-cited, popular article in *Wired* magazine, in the new era of petabyte-scale data and analytics, Anderson (2008) envisaged the death of theory, models, and the scientific method. No longer do we need to create theories about how the world works, because the data will tell us directly as we discern, in almost real time, the impacts of probes and changes we make.

This high profile article and somewhat extreme conclusion, along with others (see, for example, Mayer-Schönberger & Cukier, 2013), has, not surprisingly, attracted criticism (boyd & Crawford, 2011; Pietsch, 2014).

Educational researchers are one community interested in the application of "big data" approaches in the form of learning analytics. A critical question turns on exactly how theory could, or should shape research in this new paradigm. Equally, a critical view is needed on how the new tools of the trade enhance/constrain theorizing by virtue of what they draw attention to, and what they ignore or downplay. Returning to our opening provocation from Anderson, the opposite conclusion is drawn by Wise and Shaffer (2015, p. 6):

What counts as a meaningful finding when the number of data points is so large that something

will always be significant? [...] In sum, when working with big data, theory is actually more important, not less, in interpreting results and identifying meaningful, actionable results. For this reason we have offered Data Geology (Shaffer, 2011; Arastoopour et al., 2014) and Data Archeology (Wise, 2014) as more appropriate metaphors than Data Mining for thinking about how we sift through the new masses of data while attending to underlying conceptual relationships and the situational context.

Data-intensive methods are having, and will continue to have, a transformative impact on scientific inquiry (Hey, Tansley, & Toile, 2009), with familiar "big science" examples including genetics, astronomy, and high energy physics. The BRCA2 gene, Red Dwarf stars, and the Higgs boson do not hold strong views on being computationally modelled, or who does what with the results. However, when people become aware that their behaviour is under surveillance, with potentially important consequences, they may choose to adapt or distort their behaviour to camouflage activity, or to game the system. Learning analytics researchers aiming to study learning using such tools must do so aware that they have adopted a particular set of lenses

Let us turn now to *educators and learners*. The potential of learning analytics is arguably far more significant than as an enabler of data-intensive educational research, exciting as this is. **The new possibility is that educators and learners – the stakeholders who constitute the learning system studied for so long by researchers – are for the first time able to see their own processes and progress rendered in ways that until now were the preserve of researchers outside the system.** Data gathering, analysis, interpretation, and even intervention (in the case of adaptive software) is no longer the preserve of the researcher, but shifts to embedded sociotechnical educational infrastructure. So, for *educators and learners*, the interest turns on the ability to gain insight in a timely manner that could improve outcomes.

Topic questions:

- Can design processes from other disciplines, such as **HCI, Co-Design and Participatory design**, be unproblematically adopted for HCLA, or do they require adaptation?
- What are the **obstacles to the adoption** of HCLA design processes?
- How can the **voice of students** be taken more into account, besides the dominant thread of involving teachers? (a gap identified in the 2019 JLA special issue)
- What are the **lessons learnt from mid-to-long term HCLA studies** and how do they inform the aforementioned topic of adoption?
- To what extent can the **design tools** used in other areas be adopted or adapted for the purpose of LA design?
- Human-AI **complementarity**.
